

90707NK4000G2 CARRIAGE FRAME

Frame with carriage for sewing machine to connect piece ends.

Unit of frame and carriage to hold a chosen sewing machine for connecting end and start pieces of up to 400 cm wide textile fabrics of various kinds with a seam.

The carriage consists of a suitable base plate for the sewing machine and a cloth trimming mechanism to level uneven fabric edges and to guarantee a constant and even seam. A transfer chain driven by a gear motor moves the carriage. The speed of this movement can be set by changing the setting of the gear motor to adapt it to the speed of the sewing machine or the stitch length respectively to synchronize both feed motions.

The frame consists of two needle beds - suitable to fix the leading and trailing edge of the fabric to be sewn - a pneumatically controlled clamp bar to control the fabric in between the two needle beds, an adjustable limit switch to sew cloths of different widths below the maximum and the gear motor already mentioned in the paragraph before. The whole frame is movable on castor wheels.
